Important technical notes regarding media files from Jefferson Circuit Court to be played on the Courtroom JAVS Autolog electronic court proceedings system.

Verify that your supporting media files will work before trial.

Circuit Court Administrator's Office – 2nd floor Jefferson County Judicial Center

The Jefferson Audio Video System (JAVS) is the current technology being used by the courts in Jefferson County. The JAVS system records the live proceedings of a courtroom trial onto a computer hard drive as a multimedia file. **The JAVS Mediagate has the ability to playback a CD, DVD, MP3, JPEG pictures, and multimedia files from the Mediagate.**

Mediagate supported file types include:

Video: MPEG 1, 2, 4(MPG, MPEG, and AVI*, m2v, DAT, VOB)
Audio: Mp3, OGG, Vorbis
Photo: JPG, PNG, BMP, and GIF

However, Avi files CANNOT be played if the GMC or QPEL option is applied during the encoding process. And, some MP4 files (ESP Those from ITunes(tm)) have DRM encryption applied- Mediagate units will not play files that have DRM encryption. Another reason for some files to not play correctly is the actual file size. Generally, the Mediagate will sometimes have problems playing SINGLE files that are larger than 700mb in size. There are various technical reasons for this (memory allocation being one of them).

If you have the correct supporting files and/or want to test your files to the Mediagate before trial please, feel free to contact Shelly Knopf, Circuit Court Administrator at (502) 595-303 or ShellyKnopf@kycourts.net
